### Sampling Recommendations:

Hay Probe

1-gallon ziplock bag

5 gallon bucket for mixing

When sampling it is best to get as much of a representative mix of your hay as possible. If you have 100 bales pick 10 to pull your samples from. Mix the cores from the sampled bales in the bucket. From the bucket then fill and seal the zip lock bag.

If you do not have a hay probe, try to pull from the middle of the hay bale without losing stems and leaves by hand. Mix what you have pulled in the 5-gallon bucket. From the bucket fill and seal the zip lock bag.

Label the sample so that it is identified, and you know what it is referring to, including crop year, bale identification if applicable, field, etc.

Fill out a submission sheet and send sample to the lab
